Development of web based application for Intelligent Preparation Of The Battle Field

By

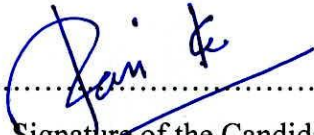

Lalinda Rasika Kumara Kahandagamage

Index Number - MSC/GR/2012033

**Thesis Submitted to the University of Sri Jayewardenepura for
award of the Degree of Master of Science in Geographic
Information Systems and Remote Sensing on 15.06.2014.**

DECLARATION OF THE CANDIDATE

The work described in this thesis was carried out by me under the supervision of Ven. Dr. Pinnawala Sangasumana and Mr Prabath Malavige and a report on this not been submitted in whole or in part to any university or any other institution for another Degree/Diploma.

.....
Signature of the Candidate

15/06/2014
.....
Date

DECLARATION OF THE SUPERVISORS

We certify that the above statement made by the candidate is true and that this thesis is suitable for submission to the University for the purpose of evaluation.

Certified by:

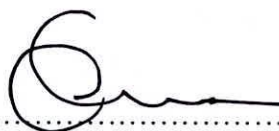

Supervisors:

.....
Dr. (Rev) Pinanawala Sangasumana
Head/Senior Lecturer
Department of Geography
University of Sri Jayewardenepura
Nugegoda
Sri Lanka.

.....15/06/2014.....

Date

.....
Mr. Prabhath Malavige
Head / GIS/ Premises Section,
Sri Lanka Ports Authority
Colombo
Sri Lanka.

.....15/08/2014.....

Date

Ven. Dr. Pinnawala Sangasumana
Head /Department of Geography
University of Sri Jayewardenepura
Gangodawila, Nugegoda,
Sri Lanka.

List of Abbreviation

GIS	-	Geographic Information System
GPS	-	Global Position System
RS	-	Remote Sensing
VPN	-	Virtual Private Network
UAC	-	User Account Control
IPB	-	Intelligence Preparation of Battlefield
IT	-	information technology
recce	-	Map reconnaissance
WebGIS	-	web-based GIS
carto	-	Cartography
CAD	-	Computer-aided design
GSM	-	Global System for Mobile communications
GPRS	-	General Packet Radio Service
WWW	-	World Wide Web
QGIS	-	Quantum Gis
PHP	-	Hypertext Preprocessor
MOD	-	Ministry of Defense
NGCCS	-	Next Generation Command and Control System
CTC	-	Concurrent Technologies Corporation
CTP	-	Integrated Common Tactical Picture
COP	-	Common Operational Picture
BFA's	-	Battlefield Functional Assets
BTRA's	-	Battle space Terrain Reasoning and Awareness
PDA	-	Personal Digital Assistant
IRNSS	-	Indian Regional Naval Satellite System
OPS	-	Operational
INT	-	Intelligent
LOG	-	Logistic
AOI	-	Area of Interest
Div	-	Division
Bde	-	Brigade
HQs	-	Headquarters
DMOS	-	Digital Map Overlay System
DTS	-	Decision Support Template
NATO	-	North Atlantic Treaty Organization
STF	-	Special Task Force

Acknowledgement

I would like to express my especial thanks and sincere gratitude to my supervisors, Dr. Pinnawala Sangasumana (Head/Geography,Coordinator- M.Sc. in GIS & RS), Accedemic staff of M.Sc. in GIS & RS and Mr Prabath Malavige, Accedemic staff of M.Sc. in GIS & RS for there invaluable guidance, encouragements, patience and precious time that he offered to me. And, I was guided step by step from the beginning and I am deeply impressed with his wealth of knowledge and dedication to academic research.

Also, I thank Major General SAPP Samarasinghe RSP USP psc, Director General Centre for Research and Development who given me freedom to attend my M.Sc. and given me encouragements during this period.

I thank prof. Krishan Deheragoda who motivated me towards this endeavour by extending his valuable guidance during reviews from the inception. Further, I thank Mr Gayal Amaranath for his support in a number of ways and time spending to bring this thesis successful.

Abstract

The application of this web-based Geographic Information System (GIS) technology greatly contributes at both ground and command level. The purpose of the research is to develop qualitative research and apply it to enhancing capacity building and to developing a decision-making tool. This application is indispensable because it allows the user to visualize, integrate and analyze all available data to obtain an accurate, direct picture of the ground. A different approach to ground data analysis was necessary due to the lack of up-to-date information on the ground hindering military missions. This web-based GIS (WebGIS) system enables users to process and generate information from the ground to the map.

Cartography (carto) is the most used and known traditional system of mapmaking. GIS is basically carto on a computer (information system). Therefore, GIS is an application of carto. In carto, technology has continually changed to meet the demands of new generations of mapmakers and map users. Advancements in electronic technology in the 20th century ushered in another revolution in carto. Ready availability of computers and peripherals such as monitors, plotters, printers, scanners and analytic stereo plotters, along with computer programs for visualization, image processing, spatial analysis, and database management, have democratized and greatly expanded the making of maps.

This study is a bridge to military planners on both a strategic and tactical level, it is crucial to have both the locations and attributes of a location in a GIS to facilitate military planning and operations. Most commercial quality maps are made using software that falls into one of three main types: Computer-aided design (CAD), GIS and specialized illustration software. Spatial information can be stored in a database, from which it can be extracted on demand. These tools lead to increasingly dynamic, interactive maps that can be manipulated digitally.

Fleet management systems have been around for a while, at least since Global Positioning System (GPS) became commercially available in the early 80s, yet many applications still do without them. This system incorporates two types of GIS and GPS applications one is situational reporting system and other one is human tracking system. This system is a new product based on the Global System for Mobile communications (GSM), General Packet Radio Service (GPRS)

network and GPS satellite positioning system. It provides multiple functions, such as security, positioning, surveillance, emergency and so on. Location information sent in code can be checked immediately in Google Maps.

This research is to connect various platforms required in military planning to one platform. The ArcGIS Server 10.1, mobile application development tools and web development tools were used to design the application. This application allows more definition, security and speed when it comes to planning and monitoring military missions. Since this application more user friendly, end users may not hesitate to use it frequently. This application is just the beginning for security forces to step into the latest technology era that will enhance existing service and activities of military.

Some software requires technical expertise and training for handling and to get the required output as required. High-end computers were imperative to run those applications. It is practically difficult to have such computers and skilled operators in each and every base. This system was mainly developed to address this issue. Most military personnel lack proper information technology (IT) literacy. The aim, therefore, is to develop an application that everyone can use without much IT background. Map reconnaissance (map recce) is a vital area for military personal. This system has developed web-based mapmaking and analysis systems for users.
