

**STUDIES ON CAROTENOID CONTENT OF SELECTED
FRUITS AND NON-LEAFY VEGETABLES OF
SRI LANKA AND THEIR BIOAVAILABILITY AND
METABOLITES**

BY

Athapaththu Mudiyansele Buddhika Priyadarshani

**This thesis submitted to the University of Sri Jayawardenepura
for the award of the Degree of Doctor of Philosophy in
Biochemistry in December 2007.**

DECLARATION BY CANDIDATE

The work described in this thesis was carried out by me under the supervision of Prof. E.R. Jansz and Prof. H. Peiris (Department of Biochemistry, Faculty of Medical Sciences, University of Sri Jayewardenepura) and a report on this has not been submitted in whole or in part to any University or any other Institution for another Degree/Diploma.

DECLARATION BY SUPERVISORS

We certify that the above statement made by the candidate is true and that this thesis is suitable for submission to the University for the purpose of evaluation.

Prof. E.R. Jansz

Prof. H. Peiris

ACKNOWLEDGEMENTS	xviii
ABSTRACT	xxi
1. INTRODUCTION	1
1.1 General introduction	1
1.1.1 Global vitamin A deficiency	1
1.1.2 Prevalence of vitamin A deficiency in Sri Lanka	1
1.1.3 Outcomes of vitamin A deficiency	2
1.1.4 Recommended daily allowance (RDA) of vitamin A	3
1.1.5 Prevention of vitamin A deficiency in Sri Lanka	3
1.2 Justification and scope of the study	5
2. LITERATURE REVIEW	8
2.1 Occurrence of carotenoids	8
2.2 Structure and classification of carotenoids	9
2.2.1 Structure of carotenoids	9
2.2.2 Classification of carotenoids	10
2.2.2.1 Carotenes and xanthophylls	10

2.2.2.2 Pro-vitamin A and non pro-vitamin A carotenoids	10
2.3 Physico-chemical properties of carotenoids	15
2.3.1 Light absorption	15
2.3.2 Quenching of singlet oxygen	16
2.3.3 Scavenging of free radicals	17
2.3.4 Solubility	17
2.3.5 Isomerization	17
2.3.6 Oxidation	18
2.4 Biosynthesis of carotenoids	18
2.5 Factors affecting carotenoid profile and content	21
2.5.1 Maturity	21
2.5.2 Varietal differences	21
2.5.3 Post-harvest handling practices	22
2.5.4 Climatic/seasonal effects	24
2.6 Digestion, absorption, transport, storage and bioconversion of carotenoids	25
2.6.1 Digestion	25
2.6.2 Absorption	25
2.6.3 Transport	26
2.6.4 Storage	27
2.6.5 Bioconversion	27
2.7 Factors affecting bioavailability of carotenoids	28
2.7.1 Dietary factors	30
2.7.1.1 Dietary effectors	30
2.7.1.2 Food matrix	31

2.7.1.3 Carotenoid type	32
2.7.2 Subject characteristics	34
2.8 Vitamin A status	35
2.9 Hypercarotenemia	35
2.10 Biological functions of carotenoids	36
2.10.1 Pro-vitamin A activity	38
2.10.1.1 Vision	38
2.10.1.2 Cell differentiation and maintenance of cell membranes	38
2.10.1.3 Embryogenesis	39
2.10.1.4 Immuno-enhancement	39
2.10.2 Prevention of cancer and cardio-vascular diseases	40
2.10.3 Prevention of macular degeneration	41
2.11 Past studies on carotenoids in Sri Lanka	42
2.11.1 Vitamin A activity	42
2.11.2 Antioxidant activity	45
2.12 Assay of carotenoids	45
2.13 Assay of <i>in-vitro</i> bioaccessible carotenoids	46
2.14 Assay of <i>in-vitro</i> antioxidant activity	47
2.15 Carotenoid profiles of selected dietary articles	47
2.15.1 <i>Daucus carota</i> (carrot)	47
2.15.2 <i>Cucurbita maxima</i> (pumpkin)	49
2.15.3 <i>Cucurbita moschata</i> (squash/batana)	49
2.15.4 <i>Ipomoea batatas</i> (sweet potato)	49
2.15.5 <i>Lasia spinosa</i> (kohila)	49

2.15.6	<i>Carica papaya</i> (papaw)	52
2.15.7	<i>Artocarpus heterophyllus</i> (jakfruit)	52
2.15.8	<i>Borassus flabellifer</i> (palmyrah)	52
3.	MATERIALS AND METHODS	54
3.1	Materials	54
3.1.1	Water	54
3.1.2	Solvents	54
3.1.3	Special chemicals	54
3.1.4	Enzymes	55
3.1.5	Dietary articles	55
3.1.5.1	<i>Daucus carota</i> (carrot)	55
3.1.5.2.	<i>Cucurbita maxima</i> (pumpkin)	56
3.1.5.3	<i>Cucurbita moschata</i> (squash/batana)	56

3.1.6	Blood samples from hypercarotenemic patients	59
3.2	Methods	65
3.2.1	Specimen preparation	65
3.2.1.1	Random specimens	65

3.2.1.2. Maturity study of stems of <i>Lasia spinosa</i> (kohila ala)	67
3.2.1.3 Storage study of <i>Ipomoea batatas</i> (sweet potato)	68
3.2.2 Determination of moisture content	69
3.2.3 Extraction of carotenoids	69
3.2.4 Partition into petroleum ether	70
3.2.5 Saponification	71
3.2.6 Concentration of carotenoid extract	72
3.2.7 Separation of carotenoids by open column chromatography (OCC)	72
3.2.7.1 Preparing the column	72
3.2.7.2 Developing the column	72
3.2.8 Identification	73
3.2.8.1 Spectrophotometry	74
3.2.8.2 Chromatographic data	74
3.2.8.3 Chemical tests	75
3.2.9 Quantification	77
3.2.9.1 OCC method	77
3.2.9.2 HPLC method	78
3.2.10 Preparation of α -carotene standard	81
3.2.10.1 Isolation of α -carotene	81
3.2.10.2 Verification of purity	81
3.2.10.3 Determination of the concentration of isolated α -carotene standard	82
3.2.11 Construction of standard curves	83
3.2.12 Retention of carotenoids in processed foods	84

3.2.12.1 <i>Daucus carota</i> (carrot)	84
3.2.12.2 <i>Cucurbita maxima</i> (pumpkin)	85
3.2.12.3 <i>Cucurbita moschata</i> (squash/batana)	85
3.2.12.4 <i>Ipomoea batatas</i> (sweet potato)	86
3.2.12.5 <i>Lasia spinosa</i> (kohila ala)	86
3.2.12.6 <i>Artocarpus heterophyllus</i> (jakfruit) autoclaving	87
3.2.13 Investigation of <i>in-vitro</i> bioaccessibility of carotenoids	87
3.2.14 Retinol activity equivalent (RAE) and retinol equivalent (RE)	90
3.2.15 Determination of fat content in vegetable dishes	90
3.2.16 Trolox equivalent antioxidant capacity (TEAC) assay	90
3.2.17 Investigation of water-soluble carotenoid	93
3.2.17.1 Isolation	93
3.2.17.2 Concentration	94
3.2.17.3 Enzymatic hydrolysis	94
3.2.17.4 Identification of sugars	94
3.2.17.5 Identification of free carotenoid	95
3.2.18 Analysis of carotenoids and vitamin A of hypercarotenemic patients	95
3.2.18.1 Ethical clearance	95
3.2.18.2 Subjects and collection of blood	96
3.2.18.3 Analysis of serum vitamin A and carotenoids	96
3.2.18.4 Analysis of serum carotenoid metabolites	97
3.2.19 Microscopic study	98
3.2.20 Statistical analysis	98

4. RESULTS	99
4.1 Preliminary results	99
4.1.1 Tlc data	99
4.1.2 Purity of the α -carotene isolate	99
4.1.3 Correction factors	99
4.2 Non-leafy vegetables	99
4.2.1 <i>Daucus carota</i> (carrot)	104
4.2.1.1 Carotenoid profile	104
4.2.1.2 Carotenoid content	104
4.2.1.3 Distribution of carotenoids in cells	107
4.2.2 <i>Cucurbita maxima</i> (pumpkin)	107
4.2.2.1 Carotenoid profile	107
4.2.2.2 Carotenoid content	108
4.2.2.3 Distribution of carotenoids in cells	114
4.2.3 <i>Cucurbita moschata</i> (squash/batana)	114
4.2.3.1 Carotenoid profile	114
4.2.3.2 Carotenoid content	114
4.2.3.3 Distribution of carotenoids in cells	117
4.2.4 <i>Ipomoea batatas</i> (sweet potato)	117
4.2.4.1 Carotenoid profile	117
4.2.4.2 Carotenoid content	121
4.2.4.3 Distribution of carotenoids in cells	121
4.2.5 <i>Lasia spinosa</i> (kohila ala)	121
4.2.5.1 Carotenoid profile	121

ACKNOWLEDGMENTS

My most heartfelt gratitude goes to my supervisor Professor E.R. Jansz (Professor of Biochemistry, Department of Biochemistry, University of Sri Jayewardenepura) for his invaluable supervision, conscientiously guidance, encouragement and valuable suggestions in the manuscripts preparations, recommendations and moral support throughout the period of my Ph.D. program. It is hard to express his commitment enabled me to complete this study successfully. I am deeply indebted to him for his immeasurable contribution in my success.

My deepest gratitude extends to my supervisor Professor H. Peiris (Department of Biochemistry, University of Sri Jayewardenepura) for his supervision, valuable guidance, advice, suggestions, comments and invaluable ideas in the manuscript preparations.

In particular, I am very thankful to Professor Sanath P. Lamabadusuriya, (Consultant Paediatrician, Department of Paediatrics, University of Colombo) for providing me serum samples with case histories of the hypercarotenemic patients and correcting of the drafts on 'hypercarotenemia'. In addition helpful discussions with him on the clinical relevance of the study on 'hypercarotenemia' are greatly appreciated.

I also wish to thank Dr. T.R.S. Seneviratne (Consultant Paediatrician, Department of Paediatrics, University of Sri Jayewardenepura) for providing me serum samples with the case histories and correcting drafts relevant to 'hypercarotenemia'.

I wish to thank Dr. U.G. Chandrika for introducing me to the project, providing me various reference resources and her University grant (ASP/6/PR/2003/14) for stipends of my initial 16 months of this study.

I am grateful to Mr. K.B. Wahundeniya (Head, Vegetable Research Division, Horticultural Crop Research and Development Institute, Gannoruwa, Peradeniya) and Mrs. Anoma Prematilaka (Research Officer, Horticultural Crop Research and Development Institute, Gannoruwa, Peradeniya) for teaching me criteria for the identification of variety/different varieties of non-leafy vegetables studied and providing me samples.

I am pleased to acknowledge Dr. R. Wickremasinghe, (Head, Department of Parasitology, University of Sri Jayewardenepura) and Dr. S. Yasawardhena (Head, Department of Anatomy, University of Sri Jayewardenepura) for allowing me to conduct microscopic studies.

International Program for Chemical Sciences (IPICS) Project SRI 07 is greatly acknowledged for all the financial support including equipments, chemicals and my stipends.

My thanks are due to Dr. P.P.R. Perera for teaching me the operation of the HPLC instrument.

My thank goes to Mr. J.K. Nikawala for the arrangements to collect palmyrah fruits from Hambantota district.

I wish to extend my gratitude to Mrs. O. Jansz for the editorial guidance during the preparation of manuscripts.

My sincerest thanks go to Mr. Rahal Widanagamage for all the computer assistance given me throughout the preparation of this manuscript.

I am pleased to thank Mr. Keerthi Aththanayaka, Mr. Prageeth Wijemanna, Mr. Indika Senevirathne, Ms. Thushari Bandara and Mrs. Ranga Edirisinghe who helped me in

different ways especially participating for the field trips on samples/specimens collections in the areas of Kurunegala, Matale, Hambantota and Gannoruwa.

I extend my sincere gratitude to all the members of academic and non-academic staff, Department of Biochemistry, University of Sri Jayewardenepura for supporting me in many ways.

I am forever grateful to my parents. My very deep appreciations go to them for their constant support in many ways throughout my study.

**STUDIES ON CAROTENOID CONTENT OF SELECTED
FRUITS AND NON-LEAFY VEGETABLES OF SRI LANKA AND
THEIR BIOAVAILABILITY AND METABOLITES**

Athapaththu Mudiyansele Buddhika Priyadarshani

ABSTRACT

Carotenoids are important as precursors of vitamin A as well as for prevention of cancers, coronary heart diseases, age-related macular degeneration, cataract etc. The objective of this study was to determine the carotenoids of some non-leafy vegetables and fruits of Sri Lanka and the effect of over-feeding of carotenoid rich diets. Carotenoid analysis procedure included specimen collection, extraction, identification and quantification. The estimation of carotenoids in selected non-leafy vegetables and fruits was carried out having made some improvements to the existing procedure with regard to sampling, identification and quantification. The mean contents of β - and α -carotenes in *Daucus carota* (carrot) were 43.8 ± 5.6 and 20.5 ± 1.7 $\mu\text{g.g}^{-1}$ fresh weight (FW), respectively whereas in *Cucurbita moschata* (squash) it was 6.0 ± 0.8 and 5.1 ± 1.1 $\mu\text{g.g}^{-1}$ FW, respectively. β -Carotene and α -carotene contents in the most common *Cucurbita maxima* (pumpkin) variety 'Arjuna' was 50.9 ± 5.7 and 27.3 ± 3.1 $\mu\text{g.g}^{-1}$ FW, respectively. The highest β -carotene content reported from *Ipomoea batatas* (sweet potato) was 59.0 ± 6.2 $\mu\text{g.g}^{-1}$ FW. Stems of *Lasia spinosa* (kohila ala) purchased from the markets showed a wide variation in carotenoid content (0.9 - 7.2 and 0.4 - 1.8 $\mu\text{g.g}^{-1}$ FW for β - and α -carotenes, respectively). The fruits *Carica papaya* (papaw) and *Artocarpus heterophyllus* (jakfruit) which have no agricultural varieties showed high heterogeneity. Therefore carotenoid content varied markedly from specimen to specimen and standard

deviation (SD) could not be calculated. In *Carica papaya* retinol activity equivalent (RAE) ranged from 25.0 to 156.7 $\cdot 100\text{g}^{-1}$ FW. In *Artocarpus heterophyllus* RAE was only in traces on the basis of fresh weight. *Borassus flabellifer* (palmyrah) fruit type IIB from Hambantota gave large SDs for carotenoids. Its RAE was negligible. *In-vitro* bioaccessibility of β -carotene was high in *Daucus carota* curry (74.7%), boiled and homogenized *Daucus carota* (73.9%) and *Carica papaya* (50.5%) but low in all other types of cooked foods due to matrix effect.

Stems of *Lasia spinosa* showed 14 and 2.3 fold increase in total pro-vitamin A carotenoid content with maturity for type A (sagittate) and B (pinnatifid) plants respectively. Carotenogenesis was found to occur in *Ipomoea batatas* under the open and gunny bag storage conditions at ambient temperature. β -Carotene content increased 2.2 and 2.3 fold after twelve days storage for open and bagged samples, respectively.

A water-soluble carotenoid was isolated from the fruit pulp of *Borassus flabellifer* and the solubility was due to glycosylation mainly by glucose and some rhamnose. The sugars were released by action of naringinase. This finding provides a basis for making a yellow natural food colour.

Hypercarotenemia was studied in eight patients with a history of frequent intake of excess of *Daucus carota*, *Carica papaya* and *Cucurbita maxima* over a period of time. This study was important as high carotenoid food intake appears to be sometimes high in Sri Lanka giving rise to this problem. Six of the patients had typical hypercarotenemia. Two atypical cases were detected. Control subjects showed no carotenoids and its metabolites in serum. The results indicate that boiled and homogenised *Daucus carota* with high β -carotene and high *in-vitro* bioaccessibility was the main cause for hypercarotenemia in Sri Lanka.
