**THE EFFECTS OF IRON DEFICIENCY ON
COGNITIVE FUNCTION AND
NEUROPHYSIOLOGICAL
FUNCTION
IN EARLY ADOLESCENT FEMALES**

by

Savithri Wasundara Wimalasekera

Thesis submitted to the University of Sri
Jayewardenepura for the award of Degree of Doctor of
Philosophy in Physiology on May 2010

The work described in this thesis was carried out by me under the supervision of Prof Kumudu Wijewardenena, Professor of Community Medicine, Faculty of Medical Sciences, University of Sri Jayewardenepura, Nugegoda, Sri Lanka; Professor Gunilla Lindmark, Department of Women's and Children's Health, Section for Women's and Children's Health, University Hospital, Uppsala, Sweden and Professor Karin Edebol Eeg Olofsson, Department of Clinical Neurophysiology University Hospital, Uppsala, Sweden; and a report of this has not been submitted in whole or in part to any university or any other institution for another degree/diploma.

CHAPTER 1	
INTRODUCTION	
1.1 Iron deficiency, the magnitude of the health problem:	1
1.2 The health effects of iron deficiency	3
1.3 Prevalence of anaemia in the world	5
1.4 Prevalence of Iron deficiency anaemia in Sri Lanka	6
1.5 Causes of Iron Deficiency	10
1.6 Diagnosis of iron deficiency	12
1.7 Iron deficiency in children	14
1.8 Brain development during adolescence	15
1.9 Cognitive development in adolescence	17
1.10 Tests of cognitive function	17
1.11 Impairment of cognition in iron deficiency	20
1.12 Evoked potentials	22

1.13	Motor and sensory nerve function in adolescence	31
1.14	Iron supplementation in adolescence	35
1.15	Objectives	39
1.15.1	<i>Main Objective</i>	39
1.15.2	<i>Specific Objectives</i>	39

CHAPTER 2

LITERATURE REVIEW

2.1	Normal iron balance in the body	40
2.2	Iron status in adolescent populations of the world and Sri Lanka	46
2.3	Development of the Brain and cognition from childhood through	50
2.4	Importance of Iron on Neurological function	54

2.10	Tests Of Nonverbal Intelligence (TONI)	70
2.11	Iron supplementation to improve cognitive and neurological Function	70

CHAPTER 3

METHODOLOGY

3.1 Design, participants and setting	74
3.2 Data collection	80
3.3 Assessment of psychosocial adversity	84
3.4 Laboratory analysis	85
3.5 Detailed Studies on Sub groups; anaemic, iron deficient, and non anaemic	95
3.6 Assessment of cognitive function	96
3.7 Assessment of Visual evoked potentials (VEP) by pattern reversal technique	106
3.8 Assessment of Brainstem Auditory Evoked Potentials (BAEP)	110
3.9 Assessment of Nerve conduction	113
3.10 Supplementation of anaemic and iron deficient subjects with iron	126
3.11 Reassessment of subjects after 90 days	126
3.12 Ethical aspects	127
3.13 Data analysis	127

CHAPTER 4

RESULTS

Section 1

4.1 Study sample	130
4.2 Prevalence and features of anaemia	131

4.3	Puberty	132
4.4	Characteristics of anaemic, iron deficient and non anaemic adolescent groups	134
4.5	Red cell indices	136
4.6	Iron status of the study sample	140
4.7	White Cell Indices of the adolescents	142
4.8	Psychosocial adversity Index	144
4.9	Parents educational level and employment	146
4.10	Number of children in the family	151
4.11	Assessment of cognitive and neurophysiological function in a subsample	152
4.12	Cognitive function assessment using the Wechesler Intelligence Tests	156
4.13	Correlation between Iron status indicators	161
4.14	Association between Iron status and Intelligence tests	163
4.15	Assessment of Visual Evoked Potentials in a subsample	173
4.16	Association of iron status indicators with Visual evoked potentials	180
4.17	Assessment of Auditory Evoked Potentials in a subsample	180
4.18	Association of iron status with Auditory Brain Stem Evoked Potentials	187
4.19	Motor and Sensory nerve function in a subsample	192
4.20	Association of iron status indicators with Motor and Sensory nerve function	196

Section 2	201
Post Supplementation Data	201
4.21 Change in the Iron status from T1 to T2	201
4.22 Change in the performances on Wechsler intelligence test scores from T ₁ to T ₂	205
4.23 Changes in Tests of Non Verbal Intelligence Scores before (T ₁) and after iron supplementation (T ₂)	210
4.24 Changes in Visual Evoked Potentials from T ₁ to T ₂	212
4.25 Changes in Brain stem Auditory Evoked Potentials from T1 to T2	215
4.26 Motor and Sensory nerve function before (T ₁) and after iron supplementation (T ₂)	218

CHAPTER 5

DISCUSSION

5.1 Characteristics of the study sample	222
5.2 Height Weight and BMI of the adolescents	222
5.3 Family income, educational and employment levels of parents among Adolescents	225
5.4 Psychosocial adversity of Adolescents	227
5.5 Prevalence of Iron deficiency and iron deficiency anaemia	227
5.6 Red cell Indices of the adolescents	233

WMI	Working Memory Index

ACKNOWLEDGEMENTS

I gratefully acknowledge the scientific inspiration, guidance and generous assistance granted to me by my supervisors, Professor Kumudu Wijewardene, Senior Professor of the Department of Community Medicine, University of Sri Jayewardenepura and Project leader of Swedish International Development cooperation Agency / Swedish Agency for Research Cooperation with Developing Countries (Sida/SAREC) Project; Prof Gunilla Lindmark, Emeritus professor of Department of Women's and Children's Health and Principal Investigator, Sida/SAREC project, of International Maternal and Child Health, Uppsala University, Sweden and Prof Karin Edebol Eeg Olofsson, Associate Professor of Department of Clinical Neurophysiology, Neurocentre, University Hospital, Uppsala University, Sweden.

I acknowledge with gratitude the scientific advice and expertise of Prof Gunilla Bohlin, Professor of Psychology, Department of Psychology, Uppsala University, Sweden in selecting the appropriate Intelligence tests, training in conducting cognitive function tests, pretesting in Sri Lankan adolescents, data analysis and preparation of the manuscript.

I acknowledge with thanks the SIDA/ SAREC project "Health care for the Socially Marginalised" for funding of the research project and the excellent scientific research training received in Sri Lanka and Sweden.

I gratefully acknowledge the meticulous technical advice on evoked potentials and nerve conduction protocols, by Katarina Farenström, senior technician of the department of Clinical Neurophysiology, Neurocenter, Uppsala University, Sweden.

I specially thank Drs Chandana Hewage and Himansu Waidyasekera my colleagues in the Department of Physiology for their assistance in data analysis, compiling the thesis, and for many hours of scientific and academic collaboration in Sri Lanka and Sweden.

I appreciate and thank the junior doctors, Dr Tharangi Silva, Dr Lakmini Wickramaarachchi, Dr Shakira Mahaboob and Dr Anushika Jayatillake, who have assisted me in data collection, coordinating the cognitive function tests, neurophysiological tests, iron supplementation, and data entry in this study.

I acknowledge the support of Dr Priya Hettiarachchi, Dr Sharaine Fernando, Dr Roshini Peiries John, my colleagues in the Department of Physiology for all the assistance and encouragement to complete this study.

I wish to thank the laboratory assistants Mr Sugath R M S Anura Kumara, and Mrs A Anusha Senevirathne; laboratory technicians, Mrs Janaki Balasuriya, Mrs D Irangani Wijemanne and Mr A H Nuwan H K Jayawickrama, for the technical assistance in carrying out the neurophysiological assessments of the adolescents.

The clerical assistance of WM Senerath Wimal Kumara, and the numerous assistance of M K Sunil Jinadasa, and N A Susith Silva, staff of the department of Physiology, are acknowledged.

I acknowledge with gratitude the scientific input, statistical advice and useful comments of Prof W. A. A. Wijeyasiri of the department of Community Medicine, Faculty of Medical Sciences, University of Sri Jayewardenepura in the preparation of this thesis.

The support given by Mrs Karin Thornblum and Ms Palika Jayatillake, the secretaries of the SIDA/SAREC project are gratefully acknowledged.

I extend my heartfelt gratitude to my husband Siva, my sisters Anoji and Maya, and my brother Aruna for their patience, support and encouragement through out this study.

I extend my gratitude to the adolescents and parents who generously spent their time to participate in this study and to the staff and principals of the participating schools for the cooperation extended to make this study a success.

ABSTRACT

Iron deficiency is the commonest micronutrient deficiency in adolescence. The WHO estimates that more than 53% of adolescents of 11- 15 years of age are iron deficient. Iron deficiency in infancy, has caused delays in psychomotor development and impaired intellectual capabilities in some populations. Adolescent females are at risk of iron deficiency due to the onset of puberty, menarche and menstruation.

The main objective of the study was to determine the iron status and its impact on cognitive and neurophysiological function in Sri Lankan female adolescents. The specific objectives were to assess the iron status among females in early adolescence; to assess cognitive function, visual evoked potentials (VEP), auditory brain stem evoked potentials (BAEP), peripheral sensory and motor nerve conduction in adolescence; to describe the association between iron status and cognitive function, VEP, BAEP, motor and sensory nerve function, in adolescent females and to determine the effect of iron supplementation of anaemic and iron deficient adolescent females on their iron status, cognitive function, VEP, BAEP, motor and sensory nerve function.

A descriptive interventional study was conducted on a study population of 11-14 yr old female adolescents from the Colombo District of Sri Lanka. Five hundred and thirty adolescents (n=530) were selected by stratified random sampling. The study instruments used were questionnaires to determine the socio-economic data, menstrual history and psychosocial adversity index; clinical examination to assess the health status and stage of puberty; venous blood examination to determine the haemoglobin level, iron profile (ie. serum iron, serum ferritin, serum total iron binding capacity and

serum transferrin) and serum albumin. In a subsample of 180 subjects (ie 60 iron deficient anaemic (IDA), 60 iron deficient (ID) and 60 non iron deficient non anaemic (NAN), cognitive function [using Wechsler Intelligence tests (WISC—IV)(Psychological Corporation, UK) and Tests of Non verbal intelligence (TONI-3)] and neurophysiological functions were assessed. The neurophysiological tests, [Visual evoked potentials (VEP), Brainstem auditory evoked potentials (BAEP), motor and sensory function of the lower limbs (MCV, F waves and SCV)] were assessed using standard measurement techniques on a Nihon Kohden Neuropack II, ENG/EMG machine (Nihon Kohden Inc, Japan).

The anaemic and iron deficient adolescents in the subsample were supplemented with iron for three months. The entire subsample was reassessed to determine the iron status, cognitive function and neurophysiological tests after three months of supplementation.

Two hundred and twenty (41.7%) adolescents aged 11- 14 years, were ID and of them 86 (16.3%) were anaemic (IDA). The mean scores of Perceptual Reasoning Index (PRI), mean scores of Working Memory Index (WMI), Verbal Comprehension Index (VCI), Processing Speed Index (PSI), and Full scale IQ (FSIQ) of anaemic adolescents and iron deficient adolescents were statistically significantly decreased when compared with the mean scores of non anaemic adolescents ($p < 0.05$). There was a significant positive correlation between iron parameters and the VCI, PRI, WMI, PSI, and the estimated FSIQ ($p < 0.05$); and the scores of Tests of Non verbal Intelligence (ToNI) ($p < 0.05$). There was poor correlation between the iron parameters (haemoglobin, serum

iron, serum total iron binding capacity, serum transferrin and serum ferritin) and the VEP among these adolescents ($p > 0.05$). There was a significant negative correlation between serum iron and waves I, II, III, IV, and V auditory brain stem evoked potentials (BAEP) of the right ear among the moderate anaemic group ($p < 0.05$). There was no significant difference in the motor and sensory nerve function between the three groups in this study.

There was a significant improvement in the VCI and the PSI in the IDA group after iron supplementation ($p < 0.05$). A significant improvement was observed in the VCI after iron supplementation in the ID group too ($p < 0.05$).

The study reveals that iron status is important for proper cognitive function development among female adolescents. There was a significant reduction in the VEP latencies, and BAEP latencies among the anaemic and iron deficient adolescents in this study. Iron supplementation for three months improved the iron status but did not completely reverse cognitive function test scores to normal. Neither were the VEP and BAEP latencies normalised by three months of iron supplementation although there was an improvement in the latencies with supplementation. The impairments seen in cognitive function and evoked potentials may be due to brain iron depletion having an effect on myelination of the central conducting pathways and maturation of iron and dopamine dependant neurotransmitters in the brain. There is an urgent need to educate parents on proper nutrition of adolescent females, since they will be the future mothers of the world.
